

G70 SHOOTING DOWN THE DICE

In this project you will be able to build a console that you will use for racing games and shooters. We replaced the joystick with a potentiometer, which changes its internal resistance by turning and can thus be used for direct control. You can attach a steering wheel to the potentiometer which will give you a more realistic experience. Before assembling the circuit according to Figure 1, set the positions of the changeover switches according to Figure 2.
